

AI Producer Release Notes

2024.3

Features & Improvements

Master volume changed to control broadcast volume

In previous versions the master volume in the production meeting controlled both the in-meeting volume and the broadcast volume. This has now been changed so that this volume control only affects the broadcast volume.

Bumpers

Bumpers are no longer seen as a general segment type in rundowns. They are now configurable as the production's "Starting Soon Bumper", its "End Slate Bumper" or as bumpers to be shown during Break segments.

Custom Layout Sets

Custom Layout Sets now include all broadcast formats. When creating a Custom Layout Set, the user will now have all layouts to all formats available for customization. Selecting custom layouts can now also be done in the Admin and User portals in addition to pre-meeting settings.

In the Control Panel during Manual Mode, only the different formats for the selected Custom Layout Set are now shown. If you want to change to a different Custom Layout Set, this is done from Segment Settings. Also, see separate document.

Profiles

Rundown templates and custom layouts from the global profiles are no longer available in all profiles. Instead, rundown templates and custom layouts are available based on the currently selected profile.

Improvements made to support collaboration between producers. All producers for a particular meeting now have access to the currently selected profiles background, logos and custom layouts.

Accessibility

Improvements have been made to better support keyboard navigation, voice narration and to bring a clearer visual experience, specifically regarding contrast ratio.
