

AI Producer Release Notes

2025.3

Features & Improvements

Dynamic Destinations

AI Producer now supports the dynamic management of destinations. Users are provided with full flexibility to automatically or manually start and stop Individual broadcast destinations. The configuration of dynamic destinations is achieved while setting up an AI Producer Production and can be managed from the Control Room and Control Panel of an ongoing production. Please have a look at our tutorial regarding Dynamic Destinations [here](#), the password is AiPtutorial!

Bumper Settings

Start and end bumpers are now always seen on the rundown timeline in the Control Room to enable users to quickly check or edit bumper settings. Managing bumper settings is now easily achieved via a bumper setting side panel.

Max Production Duration

To meet the current maximum duration of Microsoft Teams meetings, AI Producer can now run for up to thirty (30) hours without saving to OneDrive. When saving to OneDrive, the maximum duration is twelve (12) hours, and productions exceeding this limit will stop automatically.

Manage Videos

From the Control Room, users can now manage videos more efficiently via a contextual menu and a modal presenting available videos where users can preview, select, and deselect videos prior to starting, or during a production of any production format.

Chat Notifications for Meetings and Productions

Users can now choose to receive a chat message when a meeting or a production is created, in addition to the regular confirmation email. This setting can be managed from the User Portal, where you can select whether to receive chat notifications or email configurations, or both, depending on your preference.

In addition to these features and improvements, some minor enhancements have been made, and a few bugs have been fixed.
